

SPECIALIZED PAPER: ESSAYS

Suggested time: 45 minutes
Maximum score: 125 points

ESSAY A

The statistics on production of individual commodities consists of data on production of a commodity in a well specified period of time (a month, a quarter, a year). Such production is also often referred as "production intended for sale". Another component of production statistics refers to data on "production sold" for the same reference period.

- Describe the key differences between data collected according to the two approaches.
- Which form of production data is preferable for calculating statistical indicators? (provide some examples)
- Can the two forms of data be converted into one another? If so, how?
- What main difficulties arise when quantity and value information is collected according to the two approaches?
- In the table 1, partial information for a product A is shown. Calculate the missing values, assuming a LIFO (last-in-first-out) and FIFO (first-in-first-out) approach, respectively, for the inventory valuation.
- Discuss the results of different valuations in the table and how they could be used to answer question c).

Table 1: Inventories shown at the end of the period. (Quantities are given in metric tons, values in thousand dollars). Inventory at end of 2004: 0 metric tons

Year	Production intended for sale (quantity)	Production intended for sale (value)	Production sold (quantity)	Production sold (value)	Unit price	Inventory (quantity)	Inventory (value) FIFO	Inventory (value) LIFO
2005	120		110		1.00			
2006	150		145		1.10			
2007	160		170		1.15			
2008	110		100		1.20			
2009	130		140		1.25			
2010	140		140		1.20			

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet. Please copy the table to the answer booklet. Anything written on the pages of this booklet will not be considered at the time of marking.

ESSAY B

Suggested time: 45 minutes
Maximum score: 125 points

In September 2000, building upon a decade of major United Nations conferences and summits, 189 world leaders came together at United Nations Headquarters in New York to adopt the United Nations Millennium Declaration, committing their nations to a new global partnership to combat poverty, hunger, disease, illiteracy, environmental degradation, and discrimination against women. The Millennium Development Goals (MDGs) are derived from this Declaration, and all have specific time-bound targets and indicators - with a deadline of 2015.

- Several of the MDGs are targeted to improve health status of population in countries. List three statistical indicators that can be used to measure population health and explain how these indicators are calculated.
- One target of the MDGs is to reduce "under-five mortality rate" by two-thirds, between 1990 and 2015. Define the under-five mortality rate and explain how it is calculated.
- Elaborate on the interpretation of this indicator for the assessment of health status, i.e., why is this indicator important.
- List all possible sources of data to compute the "under-five mortality rate", and explain the advantage and disadvantage of each source.
- Table 2 below presents the progress made in terms of "under-five mortality rate" towards the target (reducing it by two-thirds by the end of 2015). Elaborate the progress toward the target and differences for different regions in the world.

Table 2: "Under-five mortality rates" in selected areas of the world in 1990 and 2009

Regions	1990	2009
Total	89	60
Developed region	15	7
Developing region	99	66
Northern Africa	80	26
Sub-Saharan Africa	180	129
Western Africa	68	32
Latin America and the Caribbean	52	23
Eastern Asia	45	19
South-eastern Asia	73	36
Southern Asia	122	69
Caucasus and Central Asia	78	37
Oceania	76	59

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet.

SPECIALIZED PAPER: QUESTIONS

Suggested time: 15 minutes
Maximum score: 50 points

QUESTION 1

Let Y have the probability density function given by

$$f_Y(y) = \begin{cases} \frac{y+1}{2}, & -1 \leq y \leq 1 \\ 0, & \text{elsewhere} \end{cases}$$

Find the density function U = Y².

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet.

Suggested time: 15 minutes
Maximum score: 50 points

QUESTION 2

One of the ten fundamental principles of official statistics relates to statistical confidentiality and states: "Individual data collected by statistical agencies for statistical compilation, whether they refer to natural or legal persons, are to be strictly confidential and used exclusively for statistical purposes."

- a) Since published statistics are based on such individual data, discuss issues related to confidentiality that national statistical offices face when publishing statistics on a national or sub-national level.
- b) Should individual data or data marked as "confidential" in national statistics be reported to international agencies? If so, what considerations need to be taken into account?

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet.

Suggested time: 15 minutes
Maximum score: 50 points

QUESTION 3

The manager of a chain of package delivery stores would like to develop a model for predicting weekly sales (in thousands dollars) for individual stores based on the number of customers who made purchases. A random sample of stores was selected from among all stores in the chain. The results of the regression model appear in the printout below.

Assume that the inference assumptions hold (i.e. independence, homoscedasticity, and normality).

The REG Procedure
 Model: Model1
 Dependent Variable: Weekly sales

Analysis of Variance					
Source	Degrees of freedom	Sum of Squares	Mean Square	F Value	Pr > F
Model	1	46.83354	46.83354	186.22	<0.0001
Error	?	4.52695	?		
Corrected Total	19	51.36050			

Root MSE	0.50149	R-Square	?
Dependent Mean	8.80550		

Parameter Estimates						
Variable	Label	Degrees of freedom	Parameter Estimate	Standard Error	T value	Pr > t
Intercept	β_0	1	2.42304	0.48076190	5.04	<0.0001
Customers	β_1	1	0.00873	0.00063969	13.65	<0.0001

Note: Please show the missing values and all the calculations. It is not necessary to copy the table to the answer booklet.

- a) How many stores were in the sample?
- b) Find and interpret R² in this problem.
- c) Calculate the point estimate for the sales of a store that receives 1,000 customers in a single week.
- d) At a level $\alpha = 0.05$, test the null hypothesis that there is no effect of the number of customers on the sales at a package delivery store, versus the alternative hypothesis that there is some effect. Justify your answer.
- e) Construct and interpret the 95% confidence interval for β_1 , the slope of the regression model.

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet.

Suggested time: 15 minutes
Maximum score: 50 points

QUESTION 4

A local school provides mid-day meals as a part of the strategy to improve nutrition among their students to all 2,500 elementary, middle and high school students through a catering company. The school administration would like to survey the students in the school to estimate the proportion of students who are satisfied with the food under this contract.

- Describe a simple random sampling procedure that the administration could use to select 200 students from 2,500 students in the school.
- If a stratified random sampling procedure is used, give one example of an effective variable on which to stratify in this survey. Explain your reasoning.
- Describe one statistical advantage of using a stratified random sample over a simple random sample in the context of this study.

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet.

Suggested time: 15 minutes
Maximum score: 50 points

QUESTION 5

A major metropolitan newspaper selected a simple random sample of 1,600 readers from their list of 100,000 subscribers. They asked whether the paper should increase its coverage of local news. Forty percent of the sample wanted more local news. What is the 99% confidence interval for the proportion of readers who would like more coverage of local news? Please describe the approach you use to solve this problem and which conditions need to be met for your approach to be valid. Then indicate the proper answer.

- 0.30 to 0.50
- 0.32 to 0.48
- 0.35 to 0.45
- 0.37 to 0.43
- 0.39 to 0.41

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet.

Suggested time: 15 minutes
Maximum score: 50 points

QUESTION 6

The diameter of marble balls manufactured at a large factory is normally distributed, with mean 1.3 centimetres and a variance of 0.0016 square centimetres.

- What is the probability that a randomly selected marble ball will have a diameter greater than 1.32 centimetres?
- What is the probability that a randomly selected marble ball will have a diameter between 1.28 and 1.32 centimetres?
- Between what two values (symmetrically distributed around the mean) will 68% of the marble balls fall?
- What is the probability that the sample mean diameter (\bar{Y}), calculated from $n = 16$ randomly selected balls, will be between 1.29 and 1.31 centimetres?

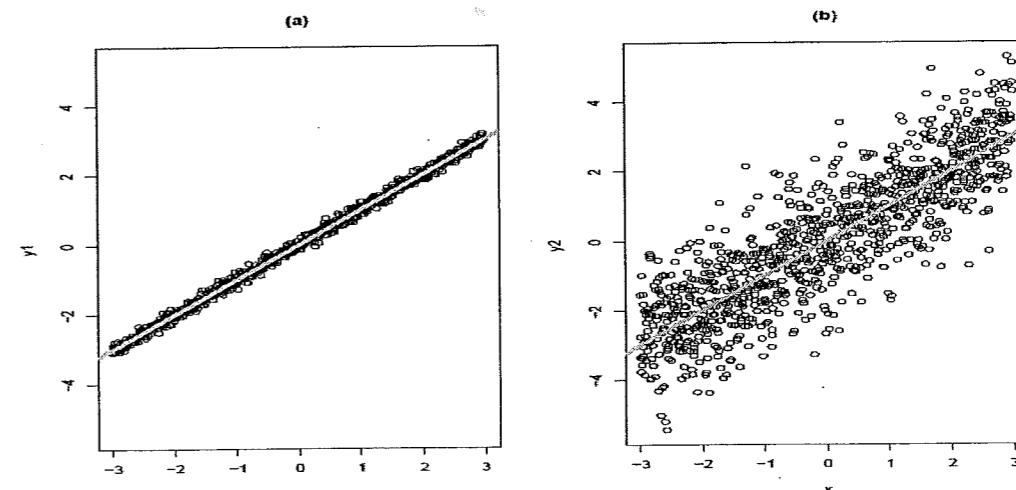

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet.

Suggested time: 15 minutes
Maximum score: 50 points

QUESTION 7

Examine the scatterplots and fitted regression lines in Figure 1. The data is such that the sample values of the independent variable (regressor) x are identical, the sample mean of the dependent variable y is the same in both data sets ($\bar{y} = 0$), and the fitted regression line is identical in both plots ($b_0 = 0, b_1 = 1$).

Figure 1: Scatterplots

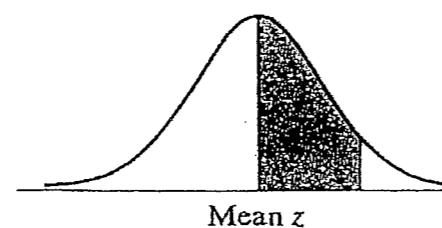

- a) Which fitted regression model has the larger R^2 value, (a) or (b)? Justify your answer.
- b) What is the sign (+ or -) of the correlation coefficient in figure (a)? Explain.
- c) Which fitted regression line, (a) or (b), has the larger Mean Square Error (MSE) or are the Mean Square Errors (MSE's) the same? Explain.
- d) Which fitted regression line, (a) or (b), has the larger Regression Mean Square (MSR), or are they the same?

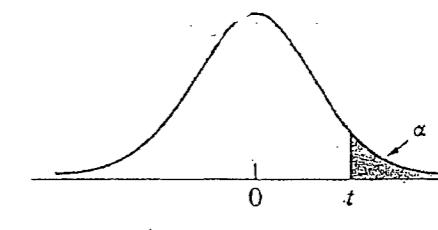

IMPORTANT: Write your answers in black or blue pen on the dedicated pages of the answer booklet.
